*Allowable Subject Matter*

Claims 1-50 are allowed.

The following is an examiner's statement of reasons for allowance:

The cited prior teaches, if the end of the data page has been reached, there are no more matches on the data page for any of the outer rows in the set that remain to be processed and another data page must be searched. In an embodiment in which the data page are not linked, the index pages of the B-tree are searched to locate another data page using the outer row that caused the end of data page to be reached as the page-finder row and there are no more matches on the data page for any outer row. The cited prior art does not suggest the claimed invention of data organization in relational database systems that deal with complex queries against large volumes of data. Specifically, claims 1, 18 and 34 are directed to use in joining two value-ordered primary index tables by loading a subset of the rows of table into memory, where the subset is consecutive and includes the first row of table, loading the first row of table into memory; comparing the loaded row of table to the loaded rows of table; outputting a match, if any; incrementing a not-match counter variable if no match is found; loading a next consecutive row of table into memory; loading new rows of table into memory and where the new rows are consecutive and are consecutive with the previously loaded rows of table. Therefore, the claimed invention improves on performance and uses minimum time possible for execution of complex queries against large amounts of data.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue
